## (54) LIQUID CRYSTAL DISPLAY DEVICE

(57)Abstract:

PROBLEM TO BE SOLVED: To simplify a manufacturing stage and to obtain a bright and high quality display in a semitransmitting type liquid crystal display device.

SOLUTION: In the semitransmitting type liquid crystal display device having a transparent area T in which a transparent electrode 4 is provided as a pixel electrode and a reflective area R in which a reflection electrode 5' is provided as a pixel electrode in a liquid crystal panel, the transparent electrode 4 in the transparent area T is formed by using an ITO film 4x and the reflection electrode 5' in the reflective area is formed by using a Ag film 18 formed directly on the ITO film 4x. And the transparent electrode 4 in the transparent area T is provided directly on a transparent substrate 2. Or, a gap between the reflection electrodes 5' adjacent to each other is shielded by a gate line 6 and a signal line 13 or light shielding layers 6x and 13x which are formed simultaneously with the formation of the gate line 6 or the signal line 13 by using the same material that used in the gate line 6 or the signal line 13.
